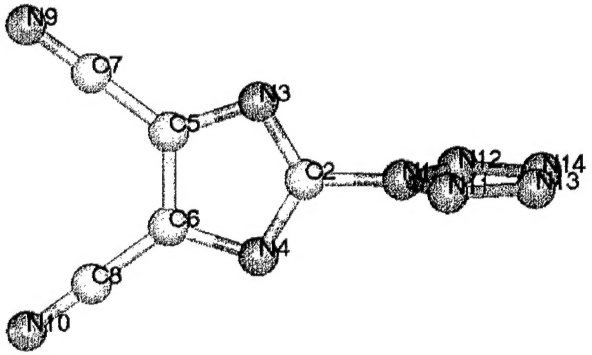
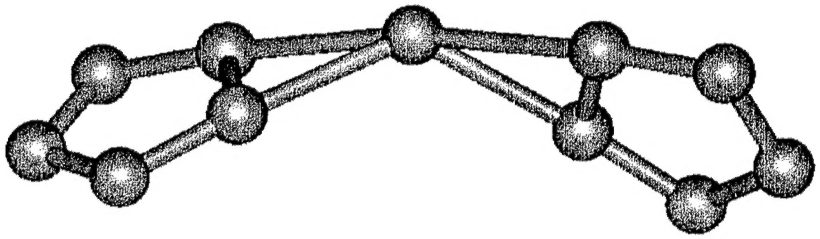
OUTLINE

1. **Project Overview**
   - High energy density materials
   - Polyhedral oligomeric silsesquioxanes (POSS)
   - Non-linear optical materials
2. **Theoretical Methods and benchmarks**
   - Ab initio electronic structure theory
   - Nuclear-electronic orbital approach
3. **Results**
4. **Summary**

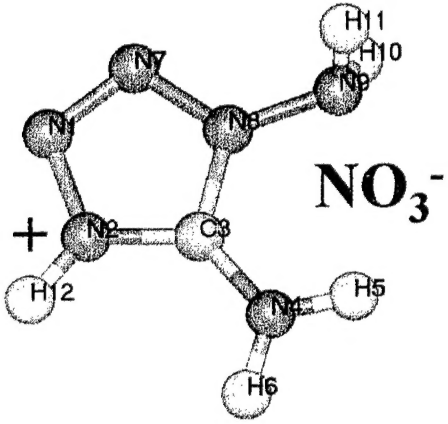
PROJECT OVERVIEW - HEDM

High Energy Density Matter -- next generation rocket propellants





High-nitrogen/polynitrogen compounds



Energetic Ionic Liquids

Specific Impulse

$$I_{sp} \propto \sqrt{\Delta H / m}$$

PROJECT OVERVIEW - HEDM

Technical issues being addressed using CCM

1. High-nitrogen/polynitrogen compounds

Objective: identify, characterize, and synthesize stable compounds with high heats of formation, high densities

- geometries, energy content, stabilities, reaction pathways

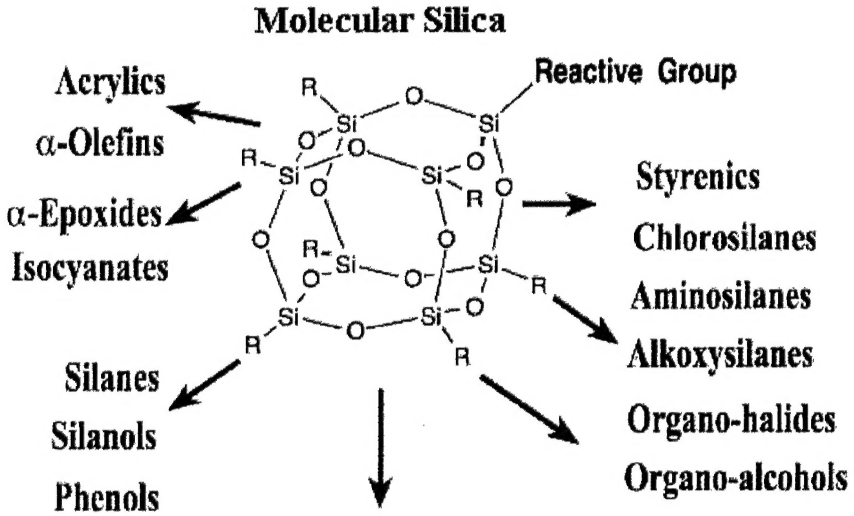
2. Energetic ionic liquids

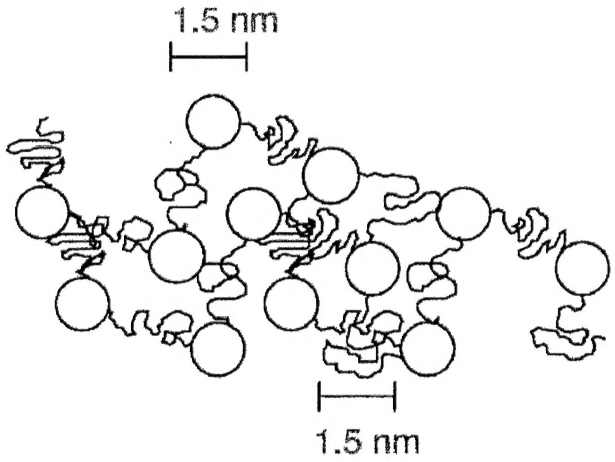
Objective: identify, characterize, and synthesize thermally stable energetic ILS with low melting points, high densities and low viscosities.

- geometries, electronic structures, stabilities, energy content, interaction potentials

PROJECT OVERVIEW - POSS

Polyhedral oligomeric silsesquioxanes -- next generation plastics





As Additives

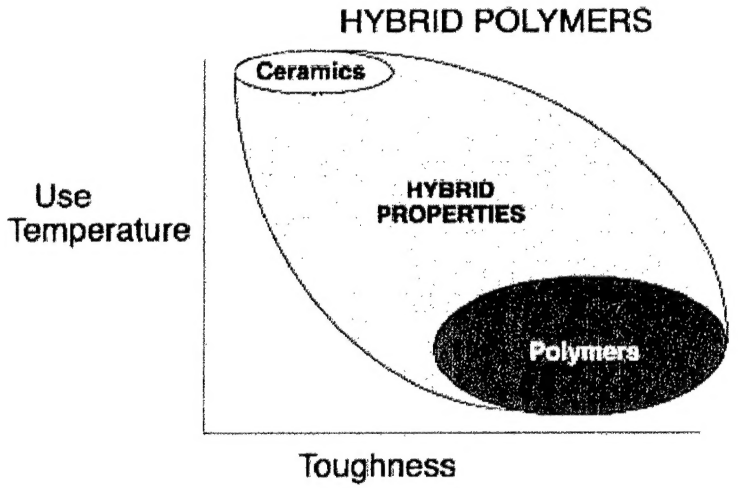
Heat/abrasion resistant paints and coatings
Mechanical property/viscosity/thermal modifiers
Crosslinking agents
Fire retardants

As Plastics

Medical materials
Space resistant resins
Packaging/coatings
Electronic materials
Optical Plastics

As Preceramics

Ablative materials (nozzles, insulations etc.)
Claddings/electronics coatings
Precursors to glassy or ceramic matrices



PROJECT OVERVIEW - POSS

Technical issues being addressed using CCM

1. Mechanisms of formation

Objective: rational design and synthesis of POSS

- role of solvents, acid/base catalysis, substituent effects on mechanism of formation

2. Potential applications as molecular "sieves"

Objective: determine if POSS cages can be used to separate small molecules

- determine barriers to encapsulation of N_2 and O_2

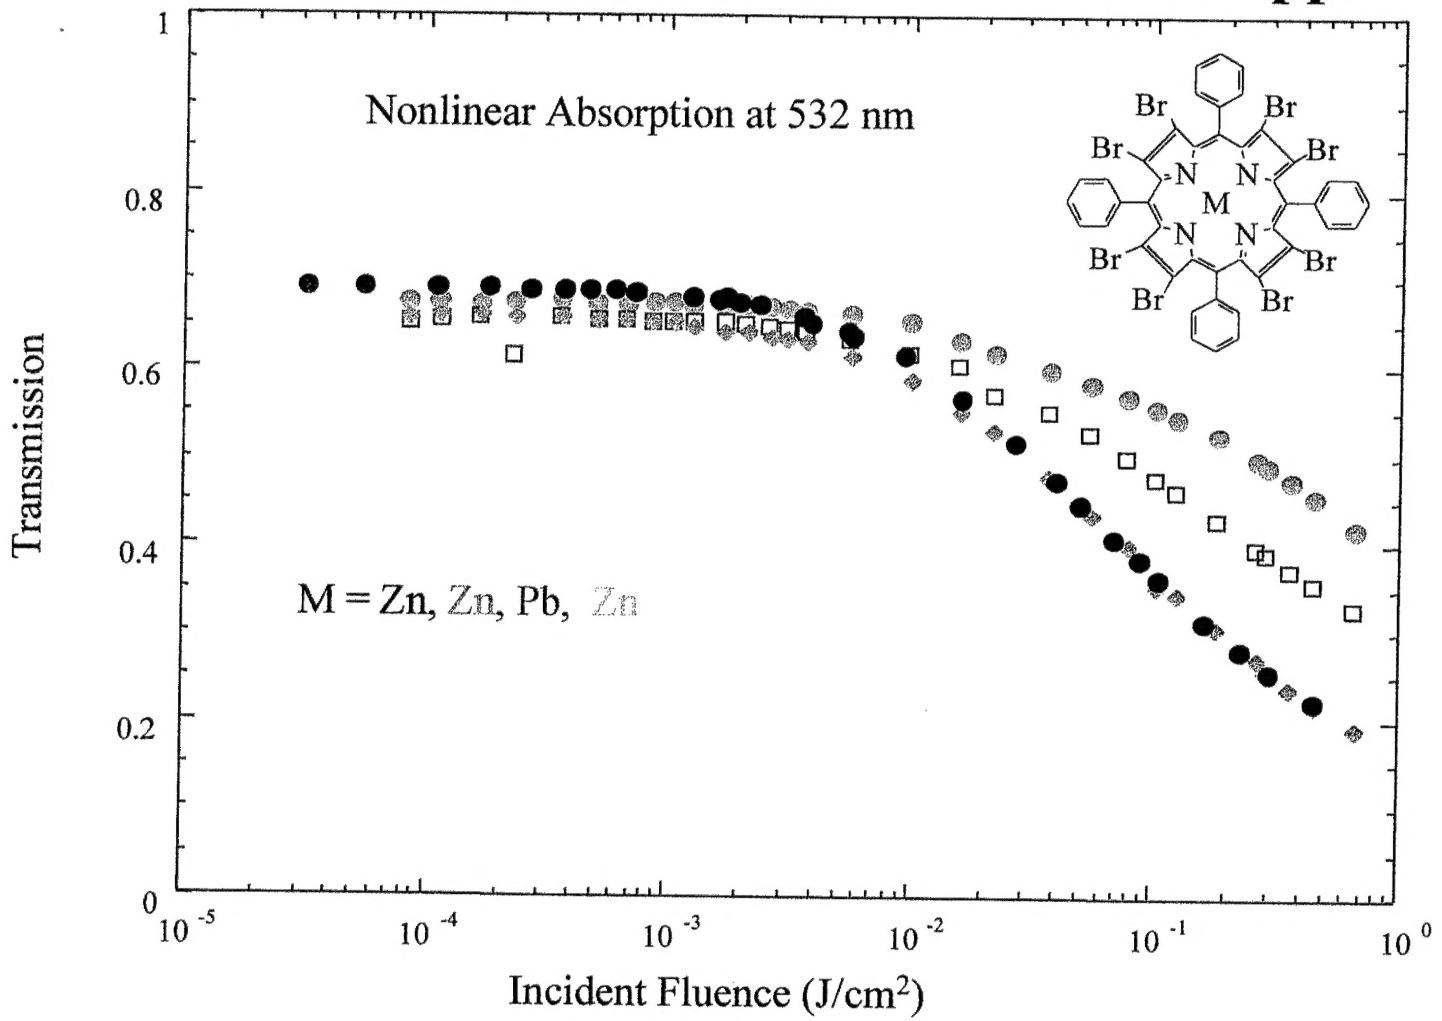
3. Ti-POSS as new catalysts

Objective: determine if Ti-POSS and Ti-siloxane compounds are effective catalysts

- determine barriers to polymerization of ethylene, oxidation by HOOH.

PROJECT OVERVIEW - NLO

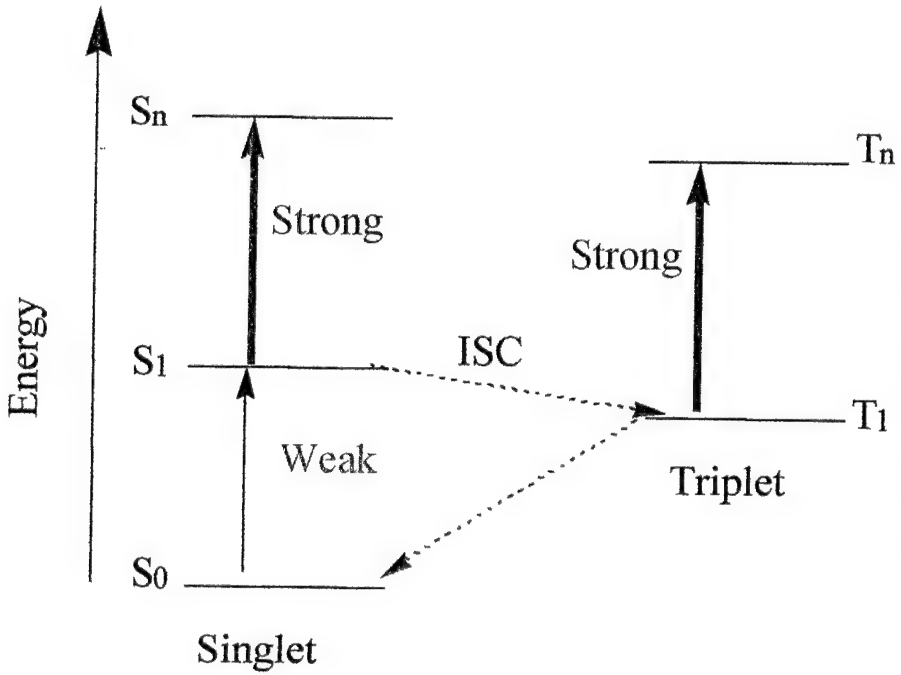
Non-linear optical materials for laser-hardened applications



PROJECT OVERVIEW - NLO

Technical issues being addressed using CCM

1. Mechanism of reverse saturable absorption (RSA)



Five-level model for nonlinear absorption

Key Components of RSA

- **Ground state spectra (linear response)**
- **Singlet-triplet splittings (ISC, phosphorescence)**
- **Ionization potential (photoionization)**
- **Excited triplet spectra (NLA)**

THEORETICAL METHODS

1. **Ab initio electronic structure theory**

   - General Atomic and Molecular Electronic Structure System (GAMESS) -- a CHSSI code

   - Nuclear-electronic orbital approach (NEO) for including nuclear quantum effects (important, e.g., in proton transfer reactions)

Various computational techniques are employed to solve the molecular electronic Schrödinger equation from quantum mechanics:

$$\left[-\frac{1}{2}\sum_i \nabla_i^2 - \sum_i \sum_\alpha \frac{Z_\alpha}{r_{i\alpha}} + \sum_i \sum_{j>i} \frac{1}{r_{ij}}\right]\Psi_{el} = E_{el}\Psi_{el}$$

Categories of approximate solutions:

a) "Self-consistent field" (SCF): reasonably good geometries
b) "Electron correlation": post-SCF correction, required for reliable energetics (e.g., barriers).

THEORETICAL METHODS

1. **Ab initio electronic structure theory (cont.)**

- Most electronic structure codes use Born-Oppenheimer (i.e., "clampled nuclei") approximation -- NOE method treats specified nuclei at QM level.

Nuclear-Electronic Hamiltonian

$$
\begin{aligned}
H_{\mathrm{tot}}(\mathbf{r}_e, \mathbf{r}_q; \mathbf{r}_c) \;=\; & -\sum_i^{N_e} \frac{1}{2}\nabla_i^2 - \sum_i^{N_e}\sum_A^{N_c} \frac{Z_A}{r_{iA}} + \sum_i^{N_e}\sum_{j>i}^{N_e} \frac{1}{r_{ij}} \\
& -\sum_I^{N_p} \frac{1}{2M_I}\nabla_I^2 + \sum_I^{N_p}\sum_A^{N_c} \frac{Z_A Z_I}{r_{IA}} + \sum_I^{N_p}\sum_{J>I}^{N_p} \frac{Z_I Z_J}{r_{IJ}} \\
& -\sum_i^{N_e}\sum_I^{N_p} \frac{Z_I}{r_{iI}} + \sum_A^{N_c}\sum_{B>A}^{N_c} \frac{Z_A Z_B}{r_{AB}}
\end{aligned}
$$

N_e: number of electrons (coordinates $\mathbf{r}_e$)
N_p: number of quantum nuclei (coordinates $\mathbf{r}_p$)
N_c: number of classical nuclei (coordinates $\mathbf{r}_c$)

THEORETICAL METHODS

Ab initio electronic structure theory

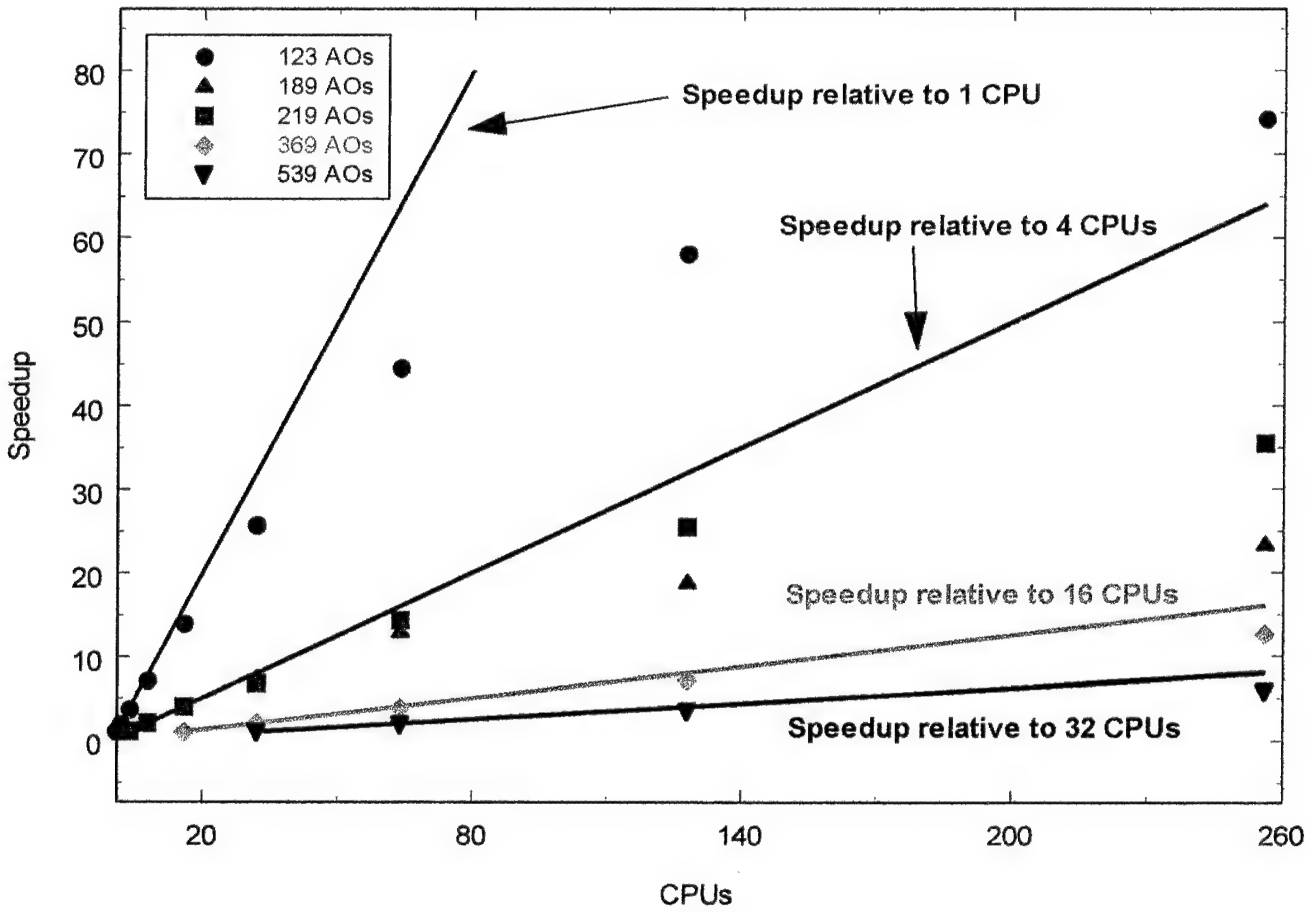
THEORETICAL METHODS

Ab initio electronic structure theory

MP2 Gradient Scalability Test

Silicocene molecule, Si(C5H5)2



The Search for New Polynitrogens

- All polynitrogens are unstable with respect to N_2 molecules
- Their activation energy for N_2 elimination is largely determined by the weakest bond in the compound
- Their metastability is enhanced if suitable resonance structures exist:

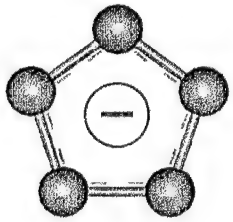
$$[\,|\overline{N}\text{–}N\equiv N|\,]^- \longleftrightarrow [\,\overline{N}\!=\!N\!=\!\overline{N}\,]^- \longleftrightarrow [\,|N\equiv N\text{–}\overline{N}|\,]^-$$

- The double-bond character of the N—N bonds in the azide anion explains its exceptional stability
- How can this stabilization effect be used to our advantage in preparing new compounds?

Pentazolate (N_5^-)?

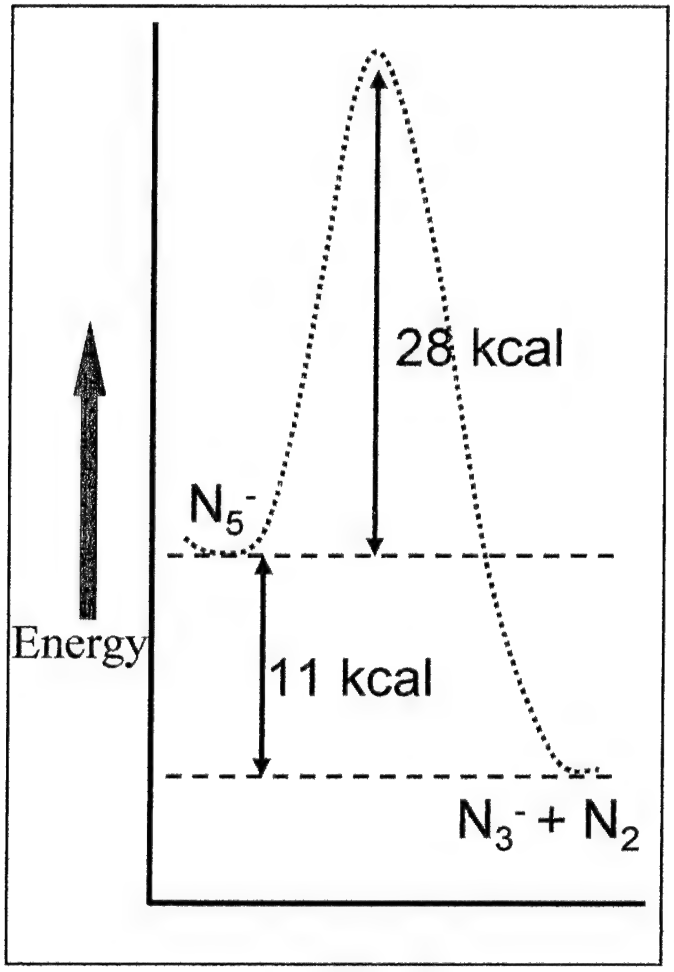
- Substituted pentazoles R-N_5 have been known for decades (R=aryl)
- Cyclic N_5^- is aromatic
- Conversion of the diazonium salt, RN_2^+, to the substituted pentazole ring R-N_5 by the reaction with azide ion, N_3^-, has been demonstrated many years ago by Ugi and Huisgen.
- N_5^- has been recently detected in the gas phase for the first time, using collisional fragmentation (electrospray ion mass spectroscopy).
- Can a chemical route to N_5^- be found? (e.g., can a suitable R group be found for the reaction R-N_2^+ + N_3^- -> R-N_5 -> R^+ + N_5^-?

New Polynitrogen Anions



Pentazole anion (N_5^-)

- *Theoretical calculations show that this anion has a 28 kcal/mole activation energy barrier for decomposition and its decomposition to N_3^- and N_2 is only 11 kcal/mol exothermic*
- *Aryl substituted pentazoles can be isolated as stable compounds only if stored at low temperatures. In methanol, these compounds rapidly decompose at room temperature to form aryl azides and N_2 gas*

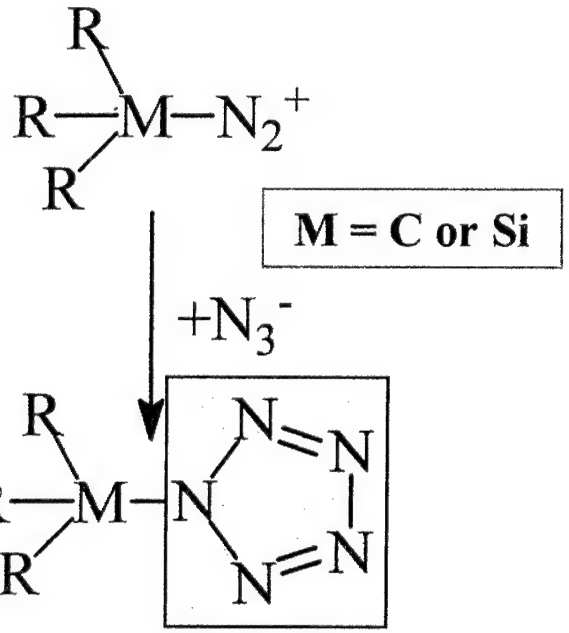


Synthetic Challenge – How do we make These New Anions??

Synthesis of Substituted Pentazoles

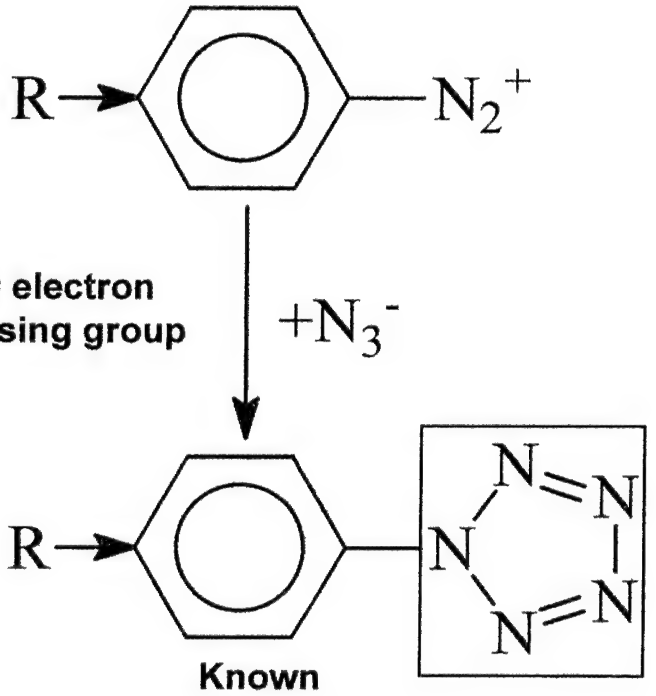
Sources for the Pentazole Anion (N_5^-)

Trityl/Silyl Diazonium Salts



Unknown

Aryl Diazonium Salts



Known

Theoretical Challenge - Can we design and predict viable precursors to N_5^-?

Find a substituent R so that

1. R-N_2^+ is stable wrt $R^+ + N_2$.

2. The R-N bond in R-N_5 is weak, thereby suitable for the reaction R-N_5 + M^+X^- -> $M^+N_5^-$ + R-X

Approach

Use quantum chemical calculations to predict the stability of R-N_2^+ diazonium salts and the length/strength of the R-N_5 bond.

MBPT(2)/6-31G(d) level of theory

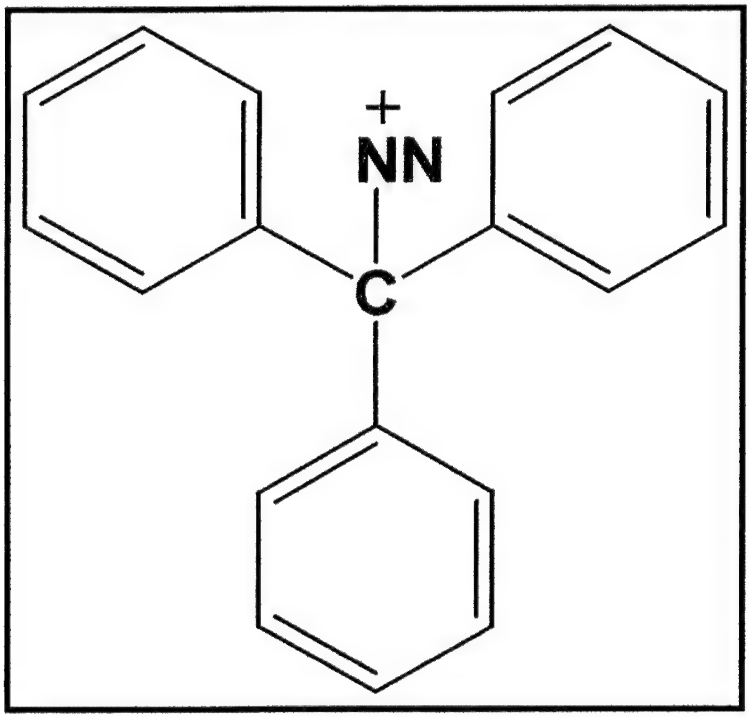
L_3M-N_2^+

M = C, Si

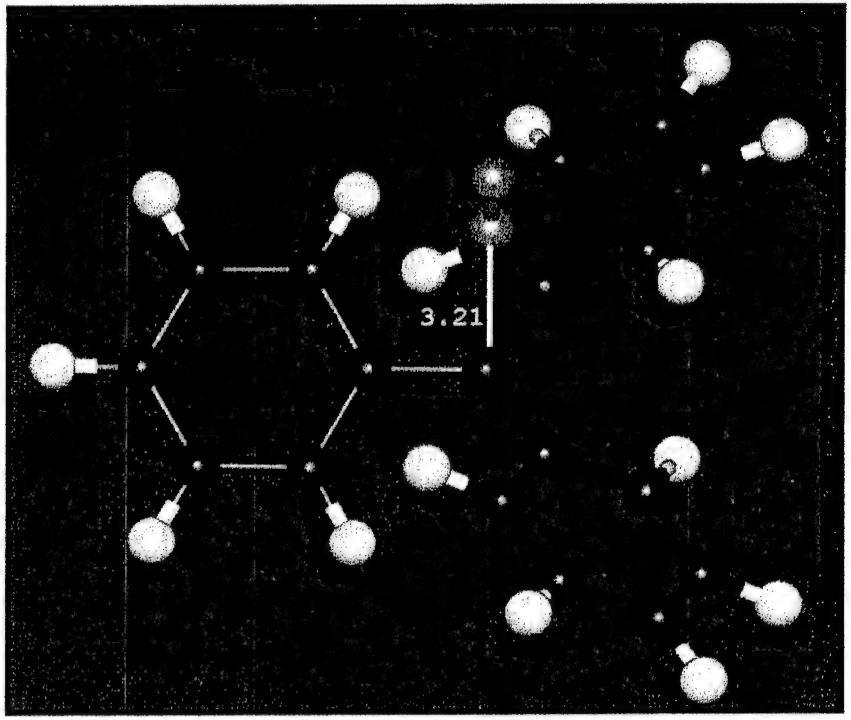
L = F, Cl, CH_3, CF_3, NO_2, phenyl, etc.

Identifying Precursors for New Polynitrogens

This ion has been suggested as a useful precursor to new polynitrogen molecules...



... but calculations predict it to be unstable.



Computational requirements: ~50,000 CPU-hours, 1.2 GW on IBM SP/P3 at ASC

RESULTS - HEDM

High-nitrogen/polynitrogen compounds

Mean Absolute Error = 0.11
Maximum Error = 0.31

Computed S_0-T_1 compared to experimental results

47 Experimental Values (in solution)
Mean Absolute Error = 0.14
Maximum Error = 0.33

100,000 hours on SGI O2K, Compaq GS320, IBM SP/P3 at ASC

SUMMARY

High Energy Density Matter

- High-nitrogen/polynitrogen compounds are substantially more energetic than hydrazine.
- Trityldiazonium cation is not a stable polynitrogen precursor.
- Trimethylsilyldiazonium cation is marginally stable, replacement of methyls with fluorines increases stability.

Polyhedral Oligomeric Silsesquioxanes (POSS)

- Nuclear quantum effects are important in proton transfer reactions -- lower barriers by about 4 kcal/mol for water-assisted condensation of trisilanol
- Most effective catalyst for olefin polymerization is T_4 cage
- Barrier is still ~10 kcal/mol too high: Ti-POSS, Ti-siloxanes may not be good catalysts for this reaction

NLO materials

- Time-dependent density functional theory accurately predicts NLA in free-base porphyrins, phthalocyanines, and their metal complexes.
- Mean absolute error of 0.11 eV for computed triplet-triplet excitation energies
- Mean absolute error of 0.14 eV for computed singlet-triplet excitation energies

FUTURE DIRECTIONS

HEDM

- Thermal decomposition mechanisms of energetic hydrocarbons (e.g., BCP).
- Energetic Ionic Liquids (QSPR models)

Kudo, T., Gordon, M.S. J. Am. Chem. Soc., 120, 11432 (1998)
Kudo, T., Gordon, M.S. J. Phys. Chem. A, 104, 4058 (2000)

RESULTS - POSS

Mechanism of formation

Key steps

1. Hydrolysis of $RSiX_3$ (R=H,CH_3,t-butyl,etc.; X=Cl)
   $RSiCl_3 + H_2O \rightarrow RSiCl_2OH + HCl$
   $RSiCl_2OH + H_2O \rightarrow RSiCl(OH)_2 + HCl$
   $RSiCl(OH)_2 + H_2O \rightarrow RSi(OH)_3$
2. Condensation of $RSi(OH)_3$ to disiloxane
   $2\ RSi(OH)_3 \rightarrow R(OH)_2SiOSi(OH)_2R + H_2O$
3. Condensation of disiloxane to D_3,D_4
   $RSi(OH)_3 + R(OH)_2SiOSi(OH)_2R \rightarrow D_3 + 2H_2O$

   [2+2]: $2R(OH)_2SiOSi(OH)_2R \rightarrow D_4 + 2H_2O$
   [3+1]: $RSi(OH)_3 + R(OH)_2SiOSi(OH)_2R \rightarrow D_4 + 2H_2O$
   Ring Expansion: $RSi(OH)_3 + D_3 \rightarrow D_4 + H_2O$
4. Condensation of D_3, D_4 to POSS (in progress)
   $2D_4 \rightarrow T_8 + 4H_2O$
   ....
